COMPANY VALUATION REPORT

Valuativa DOO

Prepared for	Valuativa DOO
Valuation date	6 October 2026
Market data	Damodaran Online (NYU Stern), 5 January 2026
Report generated	11 October 2026

At a glance

Pre-money valuation range	**€1.08M to €1.46M** if revenue comes in 20% below or above plan
Central value (your plan)	**€1,274,502** blend of Venture Capital, Comparables and DCF
Post-money valuation	**€1,574,502** after raising €300,000
Range across methods	**€828,766 (DCF) to €1,813,686 (Venture Capital)** lowest and highest method
Round logic (how a typical round would price it)	**€900k to €1.70M** pre-money if €300,000 buys a typical Seed stake of 15%–25%

Before sharing this report: *5 of your inputs need a second look (see "Checks on your inputs").*

The methods look at the company from different angles and rarely agree; the range shows how far apart they are. The revenue range shows how much the result depends on the plan.

This report is an automated, informational estimate blending four standard valuation methods. It is not a certified appraisal, and should not be relied on as financial, investment, or legal advice. It is not a valuation under IDW S1 or the German valuation law (BewG) and can't be used for tax purposes or employee share plans.

Prepared with Valuation Model by Snezhana Tuneska.

Company summary

General info

Company name	**Valuativa DOO**
Contact name	**—**
Contact email	**—**
Company address	**—**
Website	**—**
Country	**Tanzania**
Number of founders	**1**
Number of employees	**1**
Year of incorporation	**2023**
Company stage	**Startup stage**

Business profile

Business activity	**—**
Industry	**Software (Entertainment)**
Business territory	**Emerging Markets**
Business model	**SaaS**
Committed capital	**€45,000**
Exit strategy	**—**
Planned time to exit	**3 years**
Tax rate	**10.0% (your input)**

Market potential

Strength of competitors in the market	**Fractured many small players**
Strength of competitive products	**Competitive products are similar to ours**
Target market size	**< $50 million**
Revenue potential in 5 years	**$20 to $50 Million**
Sales channels / sales partners	**Key sales partners in place, channels secured, order traction**
Marketing partners	**Key partners in place**
Key competitors	**—**

Team & product

Management team experience	**Demonstrated experience as a CEO**
Willingness to step aside for an experienced CEO	**Unwilling (deal breaker)**
How complete is the management team?	**Entrepreneur only**
Product development stage	**Orders or early sales from customers**
Is the product compelling to customers?	**This product will be a necessity**
Can this product be duplicated by others?	**Solid patent protections**
Need for additional funding rounds	**None**

Latest operating performance

Revenue, last 12 months	**€300,000**
EBITDA, last 12 months	**€50,000**
EBITDA margin	**16.7%**
Cash available	**€20,000**
PP&E (current value)	**€1,240,000**

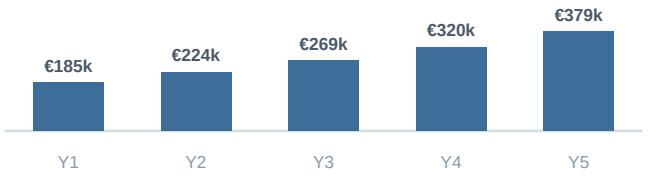
Projected financials & valuation inputs

Year 1 is the 12 months after the valuation date (6 October 2026). The EBITDA margin starts from your last-12-month margin (16.7%) and moves in equal steps to the industry margin (25.9%) by Year 5.

	Y1 (Oct 2027)	Y2 (Oct 2028)	Y3 (Oct 2029)	Y4 (Oct 2030)	Y5 (Oct 2031)
Revenue	**€1,000,000**	**€1,100,000**	**€1,210,000**	**€1,331,000**	**€1,464,100**
EBITDA margin	**18.5%**	**20.4%**	**22.2%**	**24.1%**	**25.9%**
EBITDA	**€185,145**	**€223,986**	**€268,744**	**€320,213**	**€379,289**
Capital expenditure	**€0**	**€30,000**	**€30,000**	**€30,000**	**€30,000**
Free cash flow	**€227,527**	**€181,174**	**€222,414**	**€269,791**	**€324,120**

Revenue by year

EBITDA by year



Benchmarks used — Software (Entertainment) / Emerging Markets

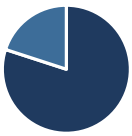
Industry EBITDA margin (Year-5 target)	**25.9%**
of which: COGS / SG&A / R&D (% of revenue, for reference)	**40.7% / 30.4% / 9.8%**
D&A (% of revenue)	**0.9% (global figure*)**
Accounts receivable / inventory / payable (% of revenue)	**7.0% / 0.2% / 15.7%**
EV/EBITDA multiple (trailing, profitable public companies)	**19.37×**
EV/Sales multiple (trailing, all public companies)	**5.90×**
Beta	**1.54**
Cost of equity / WACC	**19.00% / 18.00%**

** Damodaran has no usable figure for this region, so the industry's global figure (or the median across all industries) is used.*

Use of funds

Product and R&D	**€150,000**
Sales and marketing	**€100,000**
Capital expenditures	**€20,000**

Ownership structure (before this round)



Founder	**80.0%**
Not specified	**20.0%**

Valuation

Each method estimates the company's equity value before the new investment (pre-money). They are blended using weights for the company's stage; a method that doesn't apply to this company is left out and the other weights are scaled up, and a method that finds no value counts as €0.

Method	Stage weight	Weight used	Pre-money value	Weighted value
Scorecard	**0.0%**	**0.0%**	**not used at this stage**	**—**
Venture Capital	**30.0%**	**30.0%**	**€1,813,686**	**€544,106**
Comparables (revenue or EBITDA multiple)	**35.0%**	**35.0%**	**€1,258,079**	**€440,328**
Discounted cash flow (DCF)	**35.0%**	**35.0%**	**€828,766**	**€290,068**
Blended pre-money valuation				**€1,274,502**

Scorecard: not used at this stage. The Scorecard compares a pre-revenue company with the typical pre-revenue company in its region, so it applies only at the Idea and Development stages; companies with revenue are valued on their numbers by the other methods.

Pre-money valuation	**€1,274,502**
Capital being raised	**€300,000**
Post-money valuation	**€1,574,502**

Round logic: how a typical round would price the company

Early rounds are usually priced by the share of the company investors buy. A typical Seed round sells 15%–25% of the company (median 19.5%). Pre-money = amount raised × (1 – share) ÷ share. This is a cross-check and is not part of the blended value.

Typical Seed round size	**€879k to €3.51M**
Your round	**€300,000 (below the usual range)**
Implied pre-money (typical stake, low to high)	**€900k to €1.70M (median €1.24M)**
Share the round buys at the blended value	**19.1%**

Checks on your inputs

The calculation ran, but the points marked as warnings deserve a second look before the numbers are shared; notes explain how the data was used.

Type	Detail
Warning	Year-1 revenue (€1,000,000) is 233% above the last 12 months (€300,000). Check that this growth is realistic; every cash-flow method builds on it.
Warning	PP&E (€1,240,000) is 4.1× revenue, which is unusual for most young companies. Check the figure.
Note	In Year 1, working capital releases €59,969 of cash: in this industry, suppliers' credit (accounts payable) is larger than receivables and inventory, so growing revenue from €300,000 to €1,000,000 frees cash. This raises the DCF value; check that your suppliers will really give you this much credit.
Warning	Ownership adds up to 80.0%, not 100%.
Warning	Use of funds adds up to €270,000, but the capital needed is €300,000.
Warning	Use of funds includes €20,000 of capital expenditure, but planned capex for Year 1 is €0.
Note	Damodaran has no usable Emerging Markets figure for D&A (% of revenue) in this industry, so the industry's global figure is used.

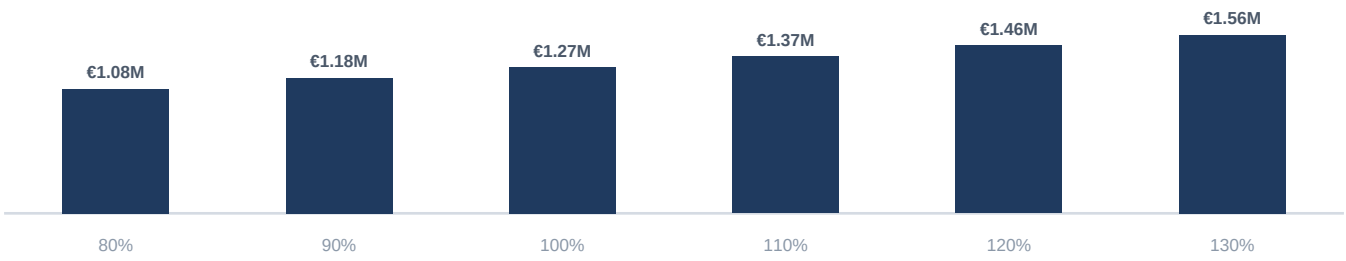
Scenario & sensitivity

How the valuation shifts if revenue comes in above or below plan (every year of the plan moves by the same percentage). Scorecard and Comparables don't move: they use your questionnaire answers and the last 12 months' figures, not projected revenue.

Method	80%	90%	100%	110%	120%	130%
Scorecard	**not used**	**not used**	**not used**	**not used**	**not used**	**not used**
VC	**€1.39M**	**€1.60M**	**€1.81M**	**€2.03M**	**€2.24M**	**€2.45M**
Comparables	**€1.26M**	**€1.26M**	**€1.26M**	**€1.26M**	**€1.26M**	**€1.26M**
DCF	**€650k**	**€739k**	**€829k**	**€918k**	**€1.01M**	**€1.10M**
Blended pre-money	**€1.08M**	**€1.18M**	**€1.27M**	**€1.37M**	**€1.46M**	**€1.56M**

The weights stay as in the main result; a method that gives no positive value in a scenario counts as €0.

Blended pre-money valuation across scenarios



Venture Capital method

Pre-money valuation

€1,813,686

How this number was reached. Projected revenue in the exit year (Y3) of €1,210,000 × the industry EV/Sales multiple of 5.90× gives an exit value of €7,133,691 (more than EBITDA €268,744 × 19.37×, as for a company still growing into its margin). An investor who needs a 50.0% annual return values that today at €7,133,691 ÷ (1 + 50.0%)^3 = €2,113,686 after the investment. Minus the €300,000 being raised = €1,813,686 before it.

Exit value

Exit-year (Y3) revenue	**€1,210,000**
Exit-year (Y3) EBITDA	**€268,744**
EV/EBITDA multiple	**19.37×**
EV/Sales multiple	**5.90×**
Exit value used	**revenue × EV/Sales (the higher)**
Exit value (enterprise value)	**€7,133,691**
Less: debt (assumed still outstanding at exit)	**€0**
Exit value for shareholders	**€7,133,691**

Value today and the new investor's stake

Years to exit	**3**
Investor's target annual return (for this stage)	**50.0%**
Post-money valuation	**€2,113,686**
Investment	**€300,000**
Pre-money valuation	**€1,813,686**
Investor ownership after the round (this method alone)	**14.2%**
Existing shareholders after the round (this method alone)	**85.8%**
Existing shares (count)	**1,000,000**
New shares to issue (count)	**165,409**
Price per new share	**€1.81**

These shares and stakes are what this method alone implies. At the blended valuation used in the rest of this report (post-money €1,574,502), the €300,000 being raised buys 19.1% of the company.

Comparables method (revenue or EBITDA multiple)

Pre-money valuation

€1,258,079

How this number was reached. Listed Software (Entertainment) companies are valued at about 19.37× their last-12-month EBITDA and 5.90× their revenue. The method takes the higher of the two values. Your revenue, last 12 months gives more (€1,768,684 against €968,465 on EBITDA), so revenue is used: young companies are compared on revenue until their profit is the bigger value driver. A private company of this stage is harder to sell than a listed one, so a 30.0% discount gives an enterprise value of €1,238,079; minus debt and plus cash gives the equity value. This method looks at today's figures, not at your growth plan; the Venture Capital and DCF methods use the plan.

EBITDA, last 12 months	**€50,000**
× EV/EBITDA multiple (trailing)	**19.37×**
= Value on EBITDA (zero if EBITDA is negative)	**€968,465**
Revenue, last 12 months	**€300,000**
× EV/Sales multiple (trailing)	**5.90×**
= Value on revenue	**€1,768,684**
Higher of the two (public-company value)	**€1,768,684**
Private-company discount (for this stage)	**–30.0%**
Enterprise value	**€1,238,079**
Less: debt	**€0**
Plus: cash	**€20,000**
Equity value (pre-money)	**€1,258,079**

Discounted cash flow (DCF) method

Pre-money valuation

€828,766

How this number was reached. Five years of projected free cash flow plus a terminal value for the years after, discounted at the company's cost of capital (18.00%), are worth €1,617,533 if the business keeps going. About 50.0% of companies at this stage survive, so the expected value is €808,766; minus debt and plus cash gives €828,766.

Unlevered free cash flow (negative numbers reduce cash)

	Y1	Y2	Y3	Y4	Y5
EBIT	**€175,879**	**€213,794**	**€257,532**	**€307,880**	**€365,723**
Tax on EBIT	**-€17,588**	**-€21,379**	**-€25,753**	**-€30,788**	**-€36,572**
Add back D&A	**€9,266**	**€10,192**	**€11,212**	**€12,333**	**€13,566**
Capital expenditure	**€0**	**-€30,000**	**-€30,000**	**-€30,000**	**-€30,000**
Change in working capital	**€59,969**	**€8,567**	**€9,424**	**€10,366**	**€11,403**
Free cash flow	**€227,527**	**€181,174**	**€222,414**	**€269,791**	**€324,120**

From cash flows to equity value

PV of 5 years of free cash flow	**€739,135**
PV of terminal value	**€878,398**
Enterprise value (if the business survives)	**€1,617,533**
Terminal value share of that value	**54.3%**
Probability of survival (for this stage)	**50.0%**
Risk-adjusted enterprise value	**€808,766**
Less: debt	**€0**
Plus: cash	**€20,000**
Equity value (pre-money)	**€828,766**

Discount rate

Risk-free rate	**3.95%**
Beta (industry)	**1.54**
Country equity risk premium	**9.77%**
Cost of equity	**19.00%**
Cost of debt after tax	**5.97%**
Equity / debt weights	**92.2% / 7.8%**
Discount rate (WACC)	**18.00%**
Long-run growth after Year 5	**2.00%**
Tax rate	**10.00%**

The terminal value treats the years after Year 5 as a business growing 2.0% a year: Year-5 profit fully taxed, capex at least D&A and working capital growing at that rate (starting cash flow €315,225).

Methods, data sources & disclaimer

Methods

Scorecard (Bill Payne): compares a pre-revenue company with the typical pre-revenue company in its region on six weighted criteria. Used only at the Idea and Development stages.

Venture Capital: values a projected exit at the higher of exit-year EBITDA × EV/EBITDA and exit-year revenue × EV/Sales (the same rule as Comparables) and discounts it at the annual return an investor at this stage targets. This is the only place a target return is used.

Comparables: applies public-company multiples to the last 12 months, taking the higher of EBITDA × EV/EBITDA and revenue × EV/Sales (ARR × the SaaS ARR multiple for subscription companies), with a private-company discount, then subtracts debt and adds cash.

Discounted cash flow: discounts projected free cash flow and a terminal value at the cost of capital (WACC), weights the result by the probability of survival, then subtracts debt and adds cash.

Market (comparable rounds; Germany, Austria and Switzerland, Startup to Growth stage): the typical pre-money of the company's round in DACH (PitchBook) × the questionnaire score, minus debt. It prices the company like a typical round, so it is often well above the fundamental methods.

The results are blended with weights for the company's stage. A method that doesn't apply to the company (for example Comparables without revenue) is left out and the other weights are scaled up; a method that applies but finds no value for the shares counts as €0, so a weaker plan never raises the result.

Round logic (cross-check, not in the blend): the pre-money at which the amount raised buys the share of the company typically sold in a round at this stage.

Assumptions for the startup stage

Investor's target annual return (VC method)	**50.0%**
Private-company discount (Comparables)	**30.0%**
Probability of survival (DCF)	**50.0%**

Data sources

Industry benchmarks: Aswath Damodaran, NYU Stern (Damodaran Online), regional industry datasets vebitda, wacc, margin, wcdata and dbtfund, updated 5 January 2026. Regional figures based on fewer than 10 companies are replaced by the industry's Global figure. D&A % and the book interest rate are derived from Damodaran's margin and debt ratios. Damodaran's 'Retail (General)' figures are used.

Revenue multiple: Derived from the same Damodaran January 2026 regional files, as EV/EBITDA (all firms) × EBITDA/Sales (all firms); both are aggregate ratios over the same companies, so the product is their total enterprise value ÷ total sales. Used by the Comparables method when revenue gives more than EBITDA (always for companies without positive EBITDA).

Country risk and tax: Aswath Damodaran, NYU Stern (Damodaran Online), country risk premiums workbook (ctryprem.xlsx), update of 1 July 2026 (default spreads corrected 9 July 2026): mature-market premium 4.20%, plus a country premium of 1.55x the rating-based default spread; corporate tax rates and regions from the same workbook. GDP figures are for 2024.

Risk-free rate: Long-term US Treasury bond rate used in Damodaran's January 2026 cost-of-capital spreadsheets (3.95%).

Long-run growth: App assumption: 2% nominal long-run growth, below the risk-free rate.

VC target returns: App assumption per stage, at the midpoint of the venture-capital target returns reported for the matching financing stage (Sahlman / Scherlis, as tabulated in Damodaran, 'Valuing Young, Start-up and Growth Companies', 2009): start-up 50-70% (Idea 65%, Development 55%), first stage 40-60% (Startup 50%), second stage 35-50% (Expansion 40%), bridge / pre-IPO 25-35% (Growth 30%). Maturity uses 20%, a typical private-equity target. Used only by the Venture Capital method.

Private-company discount: App assumption per stage, applied only to the Comparables method: public-company multiples are reduced for illiquidity and size. Restricted-stock studies commonly find about 20-35% and pre-IPO studies about 40-50%; the discount runs from 40% (Idea) to 20% (Growth, Maturity).

Survival probability: App assumption per stage, applied only to the DCF method, anchored on US BLS Business Employment Dynamics data (about 78% of new businesses survive one year, about 49% five years and about 35% ten years): Startup 50% (five-year survival), lower before revenue (Idea 30%, Development 40%), higher for established firms (Expansion 65%, Growth 80%, Maturity 95%).

Scorecard benchmark: Equidam, Startup Valuation Delta H1 2026: median pre-seed valuations from 3,000+ valuations of pre-seed companies preparing their first institutional round (results of Equidam's five-method valuations, not prices paid in closed rounds). United States $5.16M, Europe $3.30M; Emerging Markets uses the average of the Africa ($2.99M) and Latin America ($2.40M) medians; Japan, China, India and Global use the all-region median ($5.20M). Converted to euros at the ECB reference rate of 1 July 2026 (1.1383 US$ per euro). Used only for pre-revenue stages (Idea, Development).

Scorecard method: Scorecard method (Bill Payne / Ohio TechAngels), which compares a pre-revenue company with the typical pre-revenue company in its region: criterion weights 30/25/15/10/10/10 (Payne's 'need for additional investment' and 'other' 5% each are combined into 'funding required'). Used only for the Idea and Development stages; companies with revenue are valued on their numbers.

Method weights: App assumption: stage weights carried over from the original workbook, except that once a company has revenue (Startup and Expansion stages) the Scorecard's weight is spread over the other three methods (roughly in proportion, rounded: Startup 30/35/35%, Expansion 15/42.5/42.5%). In Germany, Austria and Switzerland the market method takes 25% at the Startup stage and 20% at the Expansion stage; the other weights are scaled down in proportion.

Round logic: Median share sold per round in US software companies on Carta, 2025 (seed 19.5%, Series A 18.0%, Series B 14.0%, Series C 10.0%; pre-seed SAFE rounds of $1–1.9M 15.6%, under $250k 5–6%, so 10% at the Idea stage). No German figures by stage are published. The low–high band is an app assumption. Round sizes: Dealroom round bands (pre-seed $0.1–1M, seed $1–4M, Series A $4–15M) and DealRoom Q2 2026 typical raises for Series B ($20–60M) and C ($30–100M, US), at the ECB rate of 1 July 2026. Median German VC round 2025: €4M (KfW VC Dashboard Q4 2025, Dealroom data).
